                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a protein with cation transporting activity. The genes are significantly homologous with organic cation transporters oCTI and oCT2. The genes may used in drug development, particularly in the treatment of diseases due to abnormality of the organic cation transporter functions e.g. fatty liver, heart diseases and cancers, by controlling such as by inhibition or activation. Administration of anti-tumour and anticancer drugs in combination with a transporter protein inhibiting agent allows the agents to penetrate into the diseased cells to enhance the drug action.

The genes are significantly homologous with organic cation transporters OCT1 and OCT2. The genes may used in drug development, particularly in the treatment of diseases due to abnormality of the organic cation transporter functions e.g. fatty liver, heart diseases and cancers, by controlling such as by inhibition or activation. Administration of anti-tumour and anticancer drugs in combination with a transporter protein inhibiting agent allows the agents to penetrate into the diseased cells to enhance the drug action.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Genes homologous with organic cation transporters OC^{\uparrow}_{1} a useful in design of new drugs for treatment of diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a mouse organic cation transporter protein (OCTN3). Also described are: (1) a method for screening cation into the cell, by generating a cell expressing OCTN3 at the cell membrane, contacting with the compound and organic cation; and cobserving the degree of transport of the organic cation; and (2) a method for screening compounds for their ability to be transported into the cell by OCTN3, by generating a cell expressing OCTN3 at the cell membrane, contacting with the compound and organic cation; and (2) a compound for screening compounds for their ability to be transported into the cell by OCTN3, by generating a cell expressing OCTN3 at the cell compound of the compound of the degree of transport of the compound. OCTN3 can be used for the identification of crequiators of the transport of organic cations (especially carnitine) contacting with the compound and observing the degree of contacting of the transport of organic cations (especially carnitine) contacting for use as drugs. The present sequence represents the mouse OCTN3 anino acid sequence, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                  Query Match

The genes may used in drug development, particularly in the treatment of diseases due to abnormality of the organic cation transporter functions e.g. fatty liver, heart diseases and cancers, by controlling such as by inhibition or activation. Administration of anti-tumour and anticancer drugs in combination with a transporter protein inhibiting agent allows the agents to penetrate into the diseased cells to enhance the drug action.

The wild type OCTN2 gene can be used in the gene therapy of the

                                                                                                                                                                                         The invention relates to isolated polynucleotide (I) and CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CPR primers production of (II) and is sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC to restore normal activity of (II) or to treat disease states involving CC (II), (III) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as CC a food supplement. (II) and its binding partners are useful for treating CC diagning of sites expressing (II). (I) and (II) are useful for treating CC diagnostics, forensics, gene mapping, identification or biological activity. CC The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity CC and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC amino acid sequences of the invention.

CC Note: The sequence data for this pattent did not appear in the printed CC at fip.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a protein with cation transporting activity. The genes are significantly homologous with organic cation transporters OCT1 and OCT2. The genes may used in drug development, particularly in the treatment of diseases due to abnormality of the organic cation transporter functions e.g. fatty liver, heart diseases and cancers, by controlling such as by inhibition or activation. Administration of anti-tumour and anticancer drugs in combination with a transporter protein inhibiting agent allows the agents to penetrate into the diseased cells to enhance the drug action.

The present invention describes a mouse organic cation transporter protein (CCTN3). Also described are: (1) a method for screening compounds for their ability to regulate the transport of an organic cation into the cell, by generating a cell expressing OCTN3 at the cell membrane, contacting with the compound and organic cation, and observing the degree of transport of the organic cation, and (2) a method for screening compounds for their ability to be transported into the cell by OCTN3, by generating a cell expressing OCTN3 at the cell membrane, contacting with the compound and observing the degree of transport of the compound. OCTN3 can be used for the identification of regulators of the transport of organic cations (especially carnitine) into cells by OCTN3, for use as drugs. The present sequence represents the mouse OCTN2 amino acid sequence, which is used in an example from
                                                                                                                                                                                                                                                                                                                                         Organic cation identification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Db.
      The present invention describes a mouse organic cation transporter protein (OCTN3). Also described are: (1) a method for screening compounds for their ability to regulate the transport of an organic cation into the cell, by generating a cell expressing OCTN3 at the cell membrane, contacting with the compound and organic cation, and observing the degree of transport of the organic cation; and (2) a method for screening compounds for their ability to be transported into the cell by OCTN3, by generating a cell expressing OCTN3 at the cell membrane, contacting with the compound and observing the degree of transport of the compound. OCTN3 can be used for the identification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                 11-DEC-2000

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL0187-ABL30511) expressed DNA sequences (ABL0187-ABL30512).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence data for this patent did not form part specification, but was obtained in electronic format at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventueseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL101840-ABL16175) and the encoded proteins

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhaematopolesis regulating activity and may be useful in the diagnosis and/or

cc which represent the human ORFX open reading frames I to 3161. The ORFX CS sequences have activities such as: cytostatic; hepatotropic; vulnerary: cc antipsoriatic; anticarvitatics antiarthritic; hepatotropic; vulnerary: cc antipsoriatic; anticarvitatic; antiarthritic; meuroprotective; costeopathic; anticarvitatic; antiarthritic; coagulant; vasotropic; cc antidiabetic; hypotensive; dermatological; immunosuppressant; cc antihiflammatory; antibacterial; antiviral; antifungal; antirheumatic; cc antihiflammatory; antibacterial; antiviral; antifungal; antirheumatic; cc antihipsorid; and antianaemic. The sequences can be used for determining cc the presence of or predisposition to, or preventing or treating cc pathological conditions associated with an ORFX associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy certors. The proteins and nucleic acids may be used to treat cancers, cc proliferative disorders, neurodegenerative disorders, osteoarthritis, cc proteins on hypothyroidism, cholesterol ester storage, systemic lupus crythematosus, severe combined immunodeficiency (SCID), AIDS, viral, cc allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, cc coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       31-MAR-1999;

Patent No. 5942398
Patent IN INFORMATION:
APPLICANT: Tartaglia, Louis A.
APPLICANT: Weng, Xun
TITLE OF INVENTION: NUCLEIC ACID MOLECULES
TITLE OF INVENTION: ENCODING GLUTEX AND USES THEREOF
ONRESPONDENCES: 10
CORRESPONDENCES ADDRESS:
ADDRESSEE: Fish & Richardson P.C.
TREET: 225 Franklin Street
                                                                                                                                                                                                                                                                                                   TELEPHONE: 617/542-5070
TELEPAX: 617/542-8906
TELEX: 200154
INFORMATION FOR SEQ ID NO: 10
SEQUENCE CHARACTERISTICS:
CHENCYH: 493 amino acids
TYPE: amino acid
TYPE: amino acid
TOPOLOGY: linear
HOLECULE TYPE: protein
